

How Lakeside Strengthened Security and Reduced Operational Strain with Quisitive

A security-first managed services story. Simplified, proactive, and always on.

Modern organizations don't struggle with a lack of security tools; they struggle with visibility, response, and the operational burden required to keep everything running.

In this case study, see how **Lakeside School partnered with Quisitive** to modernize operations while strengthening security oversight, reducing alert noise, and supporting a more resilient, always-on environment, without adding internal headcount or complexity.

The Challenge

Lakeside faced a familiar reality:

Growing operational demands across finance, student services, and IT

Increasing system complexity with limited internal resources

Security monitoring and response responsibilities competing with day-to-day operations

Too much noise, not enough clarity

Security couldn't be treated as a standalone toolset; it needed to be embedded into how the school operated.

The Approach

Proactive Protection, Embedded in Operations

Behind the scenes, **White Glove** represents Quisitive's role as the partner in proactive protection, a managed services approach that helped Lakeside simplify complexity, maintain control, and ensure critical systems were continuously monitored, supported, and optimized more efficiently.

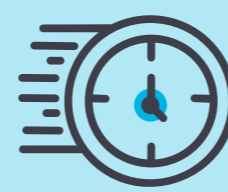

Rather than reacting to issues after the fact, Quisitive embedded security and operational oversight into day-to-day managed services, enabling:

Continuous monitoring and support

Reduced alert fatigue and operational noise

Faster response without overwhelming internal teams

Greater confidence that critical systems were always covered

This is what proactive, managed security looks like when it's built into operations, not bolted on later.

The Impact

With Quisitive's managed services and security oversight in place, Lakeside achieved:

Stronger visibility across critical systems

Reduced operational strain on internal teams

Faster issue detection and resolution

A more stable, secure, and efficient operating environment

Security wasn't treated as a standalone function; it was operationalized as part of managed services, ensuring visibility, continuity, and rapid response without overwhelming internal teams.

Is Security Embedded in Your Operations, or Competing with Them?

Lakeside reduced noise and operational strain by making security part of managed services, not a separate burden.

A Quisitive security expert will assess how you're monitoring and response fit into day-to-day operations and deliver a **30-day security plan within 24 hours**, focused on the highest-impact fixes first, so effort and spend go where it matters most.
